

While modern society is increasingly dependent on abundant energy supplies, we also recognize that energy use is a key factor in global environmental degradation. Renewable, low impact energy sources are seen as part of the solution to this issue.

Dillon is a leader in providing renewable energy services to our clients. We have worked with clients on wind, solar, biomass and run-of-river projects assisting in the approval, development and management processes.

Our renewable energy services span the entire project life cycle including:

- project risk assessment and due diligence,
- project planning and scheduling,
- environmental approvals,
- site and facility engineering,
- environmental assessment,
- air, noise, visual and biophysical analysis,
- stakeholder consultation (including aboriginals),
- transmission support/ capacity assessments/ grid connections, and
- project management.

Dillon is proud to work for many leading organizations associated with renewable energy.
